

UK Chief Medic Confirms COVID-19 Is Harmless To Majority

Despite the overall panic narrative surrounding COVID-19, there are some public officials who are telling it like it is, in this case, the UK's Chief Medical Officer. Technocrats and Big Pharma fight to suppress such views, even calling them 'fake news'. □ TN Editor

From the beginning of this crisis we have been pointing out that there are two mutually contradictory messages at the heart of the covid19 rollout, and, just as Orwell describes in 1984, a major point of the exercise seems to be to get people to believe *both at the same time*.

1. 'BE AFRAID...'

The first message is that covid19 is terrifying, unique, an existential threat to the human race.

This message is never sourced to much fact, because the facts about the

virus don't really support it. If it cites anything solid it's the appallingly sloppy and discredited Imperial computer model, or some generic research into the pathology of severe infections or rare viral syndromes, which it tries to spin as being unique to covid19, even though it is not. But mostly it doesn't cite anything at all. Or really claim anything at all.

It just tells people to be afraid. Very afraid. Of death, of uncertainty, of the 'virus', of other people, of 'fake news'.

The fear being encouraged is not rooted in facts, and is therefore impervious to them.

2. 'THERE IS NOTHING TO BE AFRAID OF...'

The second message is that covid19 is actually pretty harmless and no big deal.

This message *is* rooted in a great deal of fact, because, as we have been pointing out since day one, pretty much all the data coming out about this virus supports exactly this conclusion.

No official body has ever denied this, and most of them readily admit it. Regularly and unambiguously. Here and here and here and here.

All these sources admit the virus is 'mild' or even asymptomatic in the majority of cases, and chiefly a danger only to the already ailing or severely immuno-compromised. Just as most coronaviruses are.

So, Chris Whitty above is only one of many to point this out and this is not even his first go (see [here](#)) at explaining clearly that covid19 is only dangerous to a very very small minority of people, and that most who get it will be just fine.

Here's a slide from his talk on April 30th:

At an individual level the chances of dying of coronavirus are low.

- Over the whole epidemic, even if there is no vaccine, a high proportion will not get it.
- Of those who do, a significant proportion (exact number not yet clear) have no symptoms.
- Of the symptomatic cases, the **great majority** (around 80%) a mild-moderate disease.
- A minority have to go to hospital, most need only oxygen. The great majority of these survive.
- A minority of those need ventilation.
- A minority of every agegroup sadly die with current treatment, but even of the oldest group most do not.

Now, let's look at what he is saying in the above video, on May 11th [our emphasis]:

[T]he great majority of people will not die from this and I'll just repeat something I said right at the beginning *because I think it's worth reinforcing*:

Most people, a significant proportion of people, will not get this virus at all, at any point of the epidemic which is going to go on for a long period of time.

Of those who do, some of them will get the virus without even knowing it, they will have the virus with no symptoms at all, asymptomatic carriage, and we know that happens.

Of those who get symptoms, the great majority, probably 80%, will have a mild or moderate disease. Might be bad enough for them to have to go to bed for a few days, not bad enough for them to have to go to the doctor.

An unfortunate minority will have to go as far as hospital, but the majority of those will just need oxygen and will then leave hospital.

And then a minority of those will end up having to go to severe end critical care and some of those sadly will die.

But that's a minority, it's 1% or possibly even less than 1% overall.

And even in the highest risk group this is significantly less than 20%, ie. the great majority of people, even the very highest groups, if they catch this virus, will not die.

And I really wanted to make that point really clearly...

It seems all the officials want 'to make that point really clearly', even while they behave as if it was not true.

Why?

There's plenty of room for speculation there, and we leave it to readers to get into that BTL.

The motives, though, are less important than the basic and undeniable fact - the fear currently gripping the public mind is being simultaneously encouraged *and acknowledged as unnecessary* by the bodies overseeing the 'response'.
